

**TRI-R
HIGHLY-FLEXIBLE
RING COUPLING**

Stromag

Founded in 1932, Stromag has grown to become a globally recognized leader in the development and manufacture of innovative power transmission components for industrial drivetrain applications. Stromag engineers utilize the latest design technologies and materials to provide creative, energy-efficient solutions that meet their customer's most challenging requirements.

Stromag's extensive product range includes flexible couplings, disc brakes, limit switches, an array of hydraulically, pneumatically, and electrically actuated brakes, and a complete line of electric, hydraulic and pneumatic clutches.

Stromag engineered solutions improve drivetrain performance in a variety of key markets including energy, off-highway, metals, marine, transportation, printing, textiles, and material handling on applications such as wind turbines, conveyor systems, rolling mills, agriculture and construction machinery, municipal vehicles, forklifts, cranes, presses, deck winches, diesel engines, gensets and stage machinery.

COUPLING AT A GLANCE

STROMAG TRI-R COUPLINGS

BENEFITS INCLUDE

- Stromag TRI-R Couplings are highly flexible rubber couplings with linear spring characteristic ideal for diesel engine and resiliently mounted drives.
- Allows a simple connection of a flange, e.g. a flywheel, with a shaft. Shaft to shaft and flange to flange combinations are also available.
- Covers the torque range from 1.3 to 63 kNm. The couplings up to 16.000 Nm, the outer connection dimensions conform as a standard to the flywheel connections of the SAE standard J620. The larger couplings are basically designed with metric flywheel connections.
- Stromag TRI-R coupling allows an offset in all directions by using a combination of rubber-flexible ring element and a diaphragm of spring steel.
- Various stiffnesses and multi-row combinations of ring elements are available to get the perfect fit for your application.
- Stromag TRI-R Couplings are available with a fail-safe device.

APPLICATION AREAS

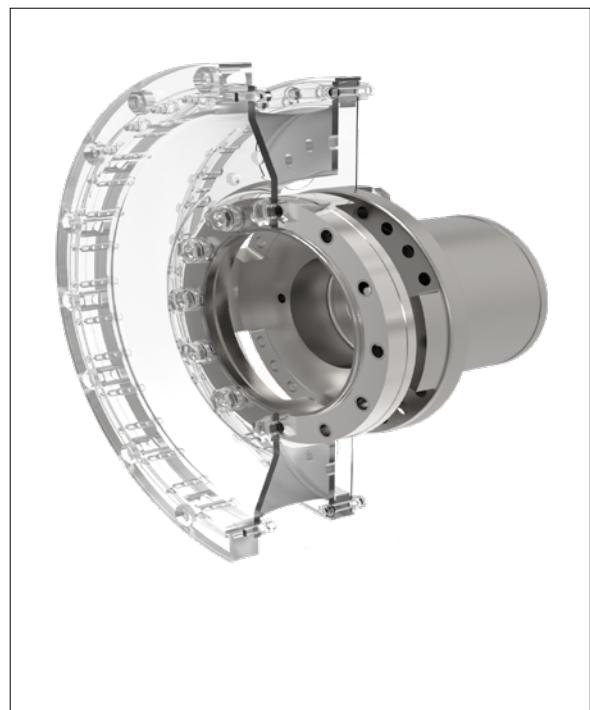

- The Stromag TRI-R Coupling is designed for applications with piston engines. The ring element can be bolted directly to the flywheel of an engine or compressor.
- Due to its high axial and radial offset capacity, the coupling is ideal for applications with resiliently mounted drives.

FAIL-SAFE DEVICE

The Stromag TRI-R coupling is available with a fail-safe device. A rupture in the flexible element causes claws to intermesh, forming a torsionally rigid, backlash connection between the drive and output sides. Temporary emergency operation is possible with limited torque. The permissible torques and speeds must be calculated separately on the basis of torsional vibrations transferred via a torsionally rigid structure.

For marine main drives, some classification societies require the use of emergency operation devices.

Stromag – Flexible Couplings

COUPLING AT A GLANCE

CLASSIFICATIONS

For survey of the coupling by a classification society, the regulations of the society have to be adhered to. The coupling characteristics may differ from the definitions given in this catalogue. Accordingly prepared data sheets are available on request.

A number of classification societies prescribe fail-safe devices on ships main drives.

TORQUE RANGE

- 1300 up to 63,000 Nm
(higher torque range on request could be possible)

INSTRUCTIONS FOR THE DESIGNER

The metal parts of Stromag TRI-R coupling are made of steel. The ring element is made of different elastomer materials in various torsional stiffnesses.

The design with natural rubber (NR) can be used within the temperature range from -50 °C up to +80 °C.

Damping work may cause the flexible element to reach temperatures higher than ambient. This must be considered when the coupling is to be fitted with a guard or cowl, and adequate ventilation and heat dissipation must be provided.

The Stromag TRI-R coupling can be delivered with EN 10204 acceptance as defined in the classification societies rules.

When stored properly, flexible rubber elements retain their properties over several years. It is essential here that the stored parts are protected against oxygen, ozone, light, heat, moisture, and solvents. Solvents, fuels, lubricants, chemicals, acids, disinfectants, and similar may not be stored in the same room. The storage temperature should not be lower than +10°C and not higher than +25°C.

All UV light sources are harmful and must be avoided. Equipment that generates ozone, e.g. light sources and electric motors, must be kept away from the storage location.

The relative air humidity should not exceed 65 %.

Further details can be taken from DIN 7716 and ISO 2230.

USE IN POTENTIALLY EXPLOSIVE ENVIRONMENTS

The coupling conforms to the requirements under Directive 2014/34/EU and can be used as follows:

- a. Zone 1 (gas, Category 2G) in Groups IIA, IIB, and IIC, T4
 - b. Zone 2 (gas, Category 3G) in Groups IIA, IIB, and IIC, T4
 - c. Zone 22 (dust, Category 3D) for dusts with a minimum ignition energy > 3 mJ, T 125°C
- Stromag TRI-R couplings compliance with the requirements for each of these zones / categories is documented in the form of the following codes on our products:

Use in gas atmospheres:

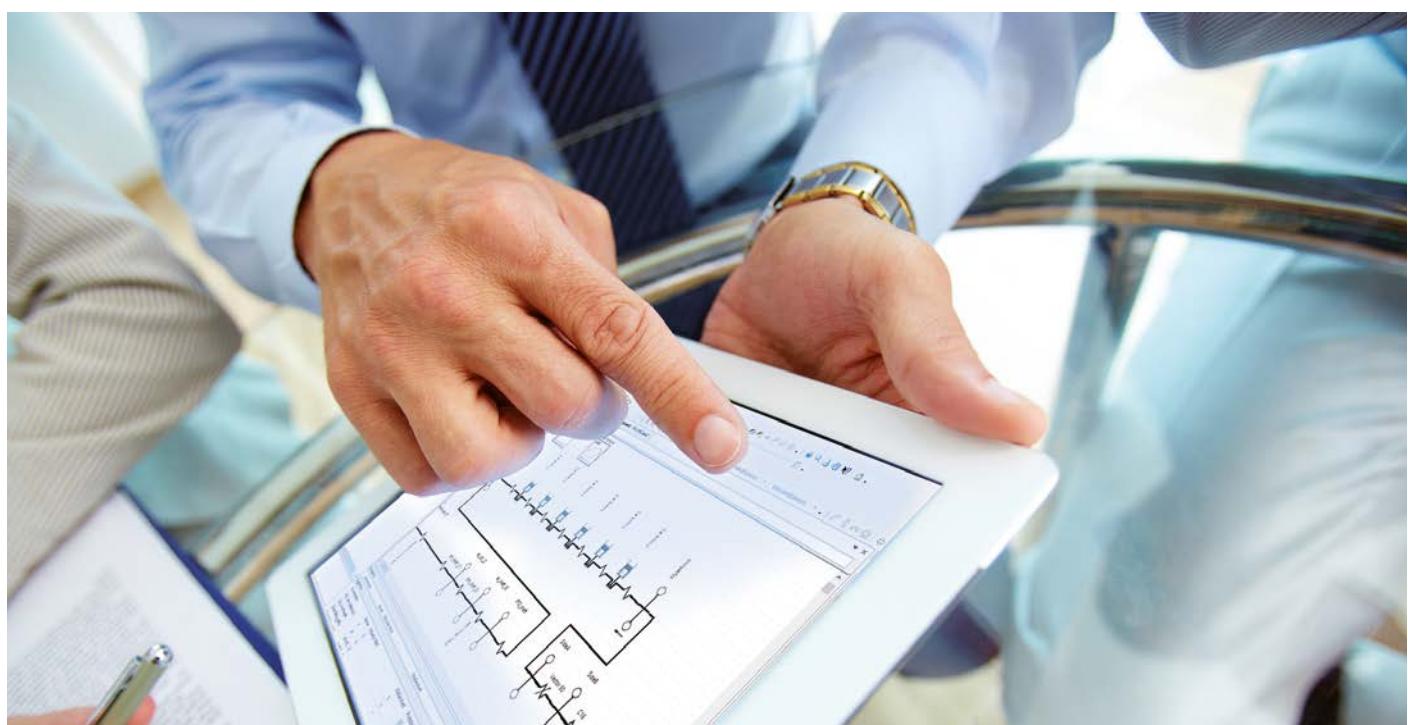

CE Ex II 2G Ex h IIC (T4) Gb

Use in dust atmospheres:

CE Ex II 3D Ex h IIIC T120°C Dc

Use in potentially explosive environments must be based on the request form annexed to this catalogue.

THE TORSIONAL VIBRATION ANALYSIS

Stromag's Know-how in Torsional Vibration Analysis (TVA) constitutes the core of each coupling design. It provides a comprehensive analysis of loads in the crankshaft, coupling and driven side to ensure that no critical speeds occur during operation.

Unevenly rotating systems can severely degrade product quality and cause great harm to the powertrain. On a daily basis, the TVA experts at Stromag work on the challenge of detecting such deviations by measuring them and protecting the entire powertrain with ideal product selection. Stromag is capable of calculating stationary and transient operating conditions considering the stiffness and damping of the elastomers.

General remark:

Output table is for single rubber element coupling. For dual rubber element coupling the characteristic values for C_r and C_{tdyn} are only half. The characteristic values for radial displacement and P_{kv} are double.

- 1) for transient repetitive vibrations during start/stop, clutching etc.
- 2) for rare occasional peak loads, e.g. short circuits in generators
- 3) dyn. axial displacement $\Delta K_{a\ dyn} = 0.33 \cdot \Delta K_a$
- 4) at $n_{max} = 600$ rpm, for higher speed ratings:

$$\Delta K_r(n) = \sqrt{\frac{600 \text{ rpm}}{n}} \cdot \Delta K_r$$
- 5) at: $TW = 0.2 \cdot T_{KN}$; $T = 0.8 \cdot T_{KN}$; $f = 10$ Hz; $\theta = 30^\circ\text{C}$

Stromag – Flexible Couplings

TRI-R Highly-Flexible Ring Coupling

Characteristics

T_{KN}	The coupling's nominal torque can be permanently transferred over the whole permitted speed range. It must be higher than the system's nominal torque T _N .	T _{KN} ≥ T _N
T_{Kmax1}	The coupling's max torque T _{Kmax1} can be endured as a peak load and may not be exceeded by peak torques T _{max1} when the system is operating in normal, nonstationary mode. A system's normal nonstationary modes are unavoidable and occur repeatedly (e.g. starting/stopping, resonance passes, switchovers, accelerations, etc.).	T _{Kmax1} ≥ T _{max1}
T_{Kmax2}	The coupling's max torque T _{Kmax2} can be endured as a peak load and may not be exceeded by peak torques T _{max2} when the system is operating in anomalous, nonstationary mode. A system's anomalous, nonstationary modes are avoidable and are not part of the planned operating scheme (e.g. emergency stops, sync failure, short circuits, etc.) Overloading the Stromag TRI-R coupling with peak torques T _{max2} in a system's anomalous nonstationary mode shortens the service life and is tolerated in individual cases.	T _{Kmax2} ≥ T _{max2}
T_{KW}	The admissible permanent alternating torque describes the amplitude of the max permanent periodic torque variation. This torque may be superimposed on a base load equal to T _{KN} . This requires in addition an analysis of the max damping power P _{KV}	
ΔK_a	Max axial displacement of the coupling. The shaft's axial displacement ΔW _a must be less than ΔK _a .	ΔK _a ≥ ΔW _a
ΔK_r	Max radial displacement of the coupling. The shaft's radial displacement ΔW _r must be less than ΔK _r .	ΔK _r ≥ ΔW _r
	The values of Δ _{Kr} for the Stromag TRI-R coupling refer to coupling shaft speeds up to 600 rpm. The conversion to other speeds is made by the equation	ΔK _r (n) = √(600 min ⁻¹ / n) • ΔK _r
	With ambient temperatures higher than 30°C, the admissible radial offset must be reduced by the temperature factor S _{θKr} .	ΔK _r (T _U) = ΔK _r / S _{θKr}
ΔK_w	Max angular displacement of the coupling. The shaft's angular displacement ΔW _w must be less than ΔK _w . A Δ _{Kw} value of 0.5° is permitted for TRI-R couplings. This value, however, may be utilised to the full only when there are no other options for shaft displacement.	ΔK _w ≥ ΔW _w
F_a	The axial reaction force of the diaphragm is stated for an offset of 1 mm. Steel diaphragms have a progressive characteristic. Formulas for the calculation of larger axial offsets on request.	

Stromag – Flexible Couplings

TRI-R Highly-Flexible Ring Coupling

Characteristics

C_r

The radial stiffness represents the ratio of radial reaction force to radial displacement.

The specified values apply to the coupling at operating temperature, with a surface temperature of about 30°C.

C_{Tdyn}

The dynamic torsional spring stiffness represents the ratio of torque amplitude to torque angle during an oscillation.

The torque amplitude is superimposed on an initial load (coupling torque).

Stromag TRI-R coupling's C_{Tdyn} value remains constant over the coupling torque (linear characteristic curve), but changes with the amplitude, frequency, and temperature of the flexible element.

The specified nominal values for C_{Tdyn} are based on a coupling torque of 0.8 • T_{KN}, an alternating torque of 0.2 • T_{KN}, and a frequency of 10 Hz on a coupling at operating temperature, with a surface temperature of about 30°C.

$$C_{T\text{dyn}} = \frac{T_{\text{el}}}{\varphi_w}$$

C_{Tdyn warm}

takes into account that high power dissipation causes the coupling to heat up.

$$C_{T\text{dyn warm}} = 0,7 \cdot C_{T\text{dyn}}$$

C_{Tdyn A}

takes into account the effects of a small alternating torque amplitude.

$$C_{T\text{dyn A}} = 1,35 \cdot C_{T\text{dyn}}$$

Calculations of torsional vibrations in the system are recommended to include C_{Tdyn warm} (0,7), und C_{Tdyn A} (1,35)

Ψ

The relative damping is a factor for the capacity of a coupling to convert a part of the occurring cyclic energy into heat.

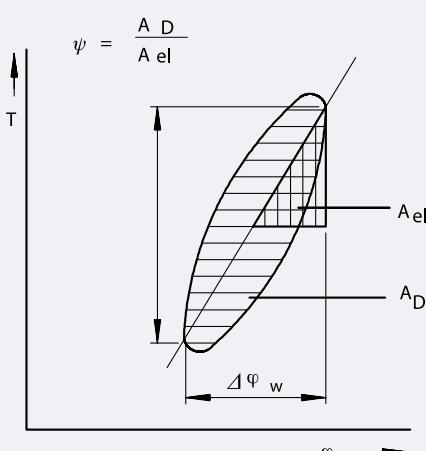

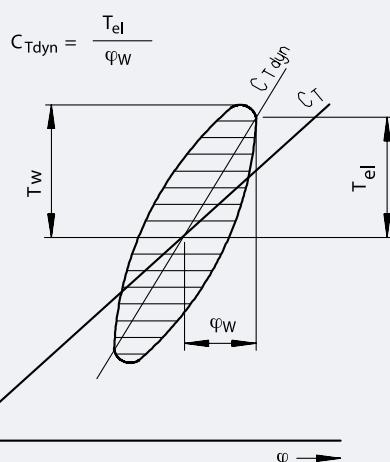

The damping can be determined by the damping loop (hysteresis loop).

The area A_D is a factor for the damping work W_D during a vibration cycle.

The area A_{el} represents the work done in deflection W_{el} at a given load.

$$\Psi = \frac{W_D}{W_{\text{el}}} = \frac{A_D}{A_{\text{el}}}$$

The specified nominal values for Ψ are based on a coupling torque of 0.8 • T_{KN}, an alternating torque of 0.2 • T_{KN}, and a frequency of 10 Hz on a coupling at operating temperature, with a surface temperature of about 30°C.

TRI-R Highly-Flexible Ring Coupling

Characteristics

P_{KV}

The admissible damping power indicates how much damping (heat) the coupling can permanently absorb resp. dissipate. The sum of the damping power of each vibration order (i.e. $\sum P_{Vi}$) must be less than the damping power of the coupling.

$$P_{Vi} = \frac{\pi}{\sqrt{\left(\frac{2\pi}{\Psi}\right)^2 + 1}} \cdot \frac{T_{wi}^2 \cdot f_i}{C_{tdyn}}$$
$$P_{KV} \geq \sum P_{Vi}$$

The stated value P_{KV60} describes the damping power which can be absorbed over the period of 1 hour. To determine the damping power which can be permanently absorbed ($P_{KV\infty}$), the value P_{KV60} has to be multiplied by the factor 0.5. With an ambient temperature T_u higher than 30°C, the admissible damping power must be reduced by the temperature factor $S_{\vartheta PKV}$

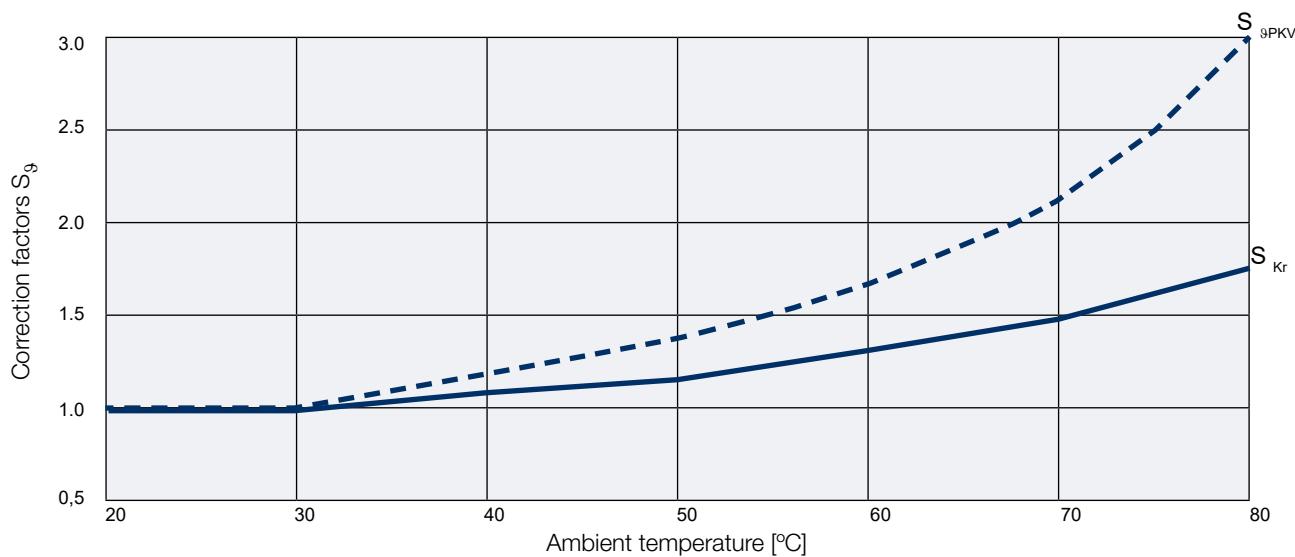

$$P_{KV}(T_u) = \frac{P_{KV}}{S_{\vartheta PKV}}$$

Temperature factors S_{Kr} und S_{PKV}

Temperature factors shall take into consideration the reduction of the physical characteristics of rubber-flexible material caused by heating.

The coupling temperature is determined by the ambient temperature plus an internal heating caused by internal material friction in the rubber volume, resulting from alternating torques and alternating loads due to shaft offsets.

With higher ambient temperatures the coupling characteristic values Δ_{Kr} and P_{KV} must be reduced through the corresponding temperature factors $S_{\vartheta Kr}$ and $S_{\vartheta PKV}$

Premier Industrial Company Leading Brands

OTHER PRODUCT SOLUTIONS FROM **REGAL REXNORD**

Our comprehensive product offerings include various types of clutches and brakes, overrunning clutches, engineered bearing assemblies, gearing and gear motors along with linear motion products, belted drives, couplings, limit switches, precision motors, drives & controls, and miniature motors. With thousands of product solutions available, Regal Rexnord provides true single source convenience while meeting specific customer requirements. Many major OEMs and end users prefer Regal Rexnord products as their No. 1 choice for performance and reliability.
