## Base Mounted Clutch/Brake Combinations

AWarner Electric
Altra Industrial Motion

## Warner Electric

Founded in 1927, Warner Electric has grown to become a global leader in the development of innovative electromagnetic clutch \& brake solutions. Warner Electric engineers utilize the latest materials and manufacturing technologies to design long life, easy-to-use clutches and brakes that provide improved accuracy and repeatability. Warner Electric offers the broadest selection of industrial clutches, brakes, controls and web tension systems available from a single manufacturer.

Reliable Warner Electric components are used in a wide range of markets including material handling, packaging machinery, food \& beverage, elevator \& escalator, turf \& garden, agriculture, off-highway, forklift, crane and motion control. Applications include conveyors, lift trucks, wrapping machines, servo motors, capping equipment, combines, balers, baggage handling systems, military vehicles, hoists and lawn mowers.

## Altra Motion

Altra is a leading global designer and producer of a wide range of electromechanical power transmission and motion control components and systems. Providing the essential control of equipment speed, torque, positioning, and other functions, Altra products can be used in nearly any machine, process or application involving motion. From engine braking systems for heavy duty trucks to precision motors embedded in medical robots to brakes used on offshore wind turbines, Altra has been serving customers around the world for decades.

Altra's leading brands include Ameridrives, Bauer Gear Motor, Bibby Turboflex, Boston Gear, Delevan, Delroyd Worm Gear, Deltran, Formsprag Clutch, Guardian Couplings, Huco, Jacobs Vehicle Systems, Kilian, Kollmorgen, Lamiflex Couplings, Marland Clutch, Matrix, Nuttall Gear, Portescap, Stieber, Stromag, Svendborg Brakes, TB Wood's, Thomson, Twiflex, Warner Electric, Warner Linear and Wichita Clutch.

## Base Mounted Clutch/Brake Combinations

## Packaged Performance Products

## Electromagnetic Clutches and Brakes

## Packaged Products Benefits

Warner Electric Packaged Products come pre-assembled, ready to install right out of the box.

Warner Electric Packaged Products consist of a single part number in most cases. One part number to inventory, one part number to track in your engineering system.

All Warner Electric packaged products incorporate our Autogap ${ }^{\text {TM }}$ mechanism that automatically adjusts for wear. This eliminates the need for maintenance, but more importantly, it ensures the same engagement time cycle after cycle after cycle through the whole life of the unit ensuring consistent product manufacturing processes.

Warner Electric Packaged designs are available for:

- C-face mount applications
- Parallel shaft applications
- Base mount applications

## The Basics

The electric clutch and brake has been called the best thing that ever happened to the electric motor. It's simple, electric clutches and brakes do all the work, while permitting motors to run smoothly and continuously at their most efficient speed by connecting/ disconnecting the motor and the load. Fast starts and stops, easy control interface, remote pushbutton operation and smooth acceleration and deceleration are outstanding user benefits.

## Reliable Performance

High cycle rates
Smooth soft startsCushioned stopsAccurate positioning
$\square$ IndexingJogging
$\square$ Reversing
$\square$ Speed changing

## Principle of Operation

A key feature of Warner Electric brakes and clutches is the method of actuation. Like an electromagnet, they have two basic parts. A magnetic field is generated as soon as the current flows through the magnet coil. This draws the armature into direct contact with the magnet. The strength of the magnetic field is directly proportional to the amount of current applied. Full range torque control from 0 to $100 \%$ is as simple as turning the knob on a light dimmer.

## Fast and Accurate

The benefits of electric actuation combined with the use of small, low inertia components is fast response, high cycle rates, and increased accuracy. While other devices are often sluggish and slow to respond, electric brakes and clutches respond instantly, resulting in higher productivity and better consistency.

## Easy to Select

Most of the time, all you need to know is motor horsepower and the speed at the brake or clutch location. Warner Electric takes care of the rest. The performance you require is built in, and with the broad range of products to choose from, you won't have to compromise with a clutch or brake that's a little too big or a little too small.

## Maintenance Free

Warner Electric brakes and clutches are clean and quiet. They require no maintenance. They never need lubrication, and they're completely self adjusting for wear. No complicated air system or messy hydraulics. Warner Electric brakes and clutches are outstandingly trouble free.

## Controllable

Electric brakes and clutches are incredibly easy to control. The shift from positive, instantaneous engagement to soft, cushioned starts and stops is as simple as turning a knob.

## Torque/Current Curve

## NEMA C-face Clutches, Brakes and Clutch Brake Combinations P-8586-WE

Electro Module
Individual Clutch and Brake Modules

EM Series
Modular Components that are Easily Combined

## - 5 sizes

- 16 clutch and brake modules
- 16 to 95 lb . ft. torque range

Individual modules may be used in combination to form clutches, brakes or clutch/brake packages.

Electro Modules can be bolted directly to NEMA C-face motors or reducers, or base mounted for stand alone operation.

See P-8586-WE for Service Parts

## UniModule ${ }^{\circledR}$

One Piece Preassembled Clutches and Clutch/Brakes

## UM Series

C-face or Base Mounted Units

- 5 sizes
- 20 combinations
- 16 to 95 lb . ft. torque range

UniModule clutches and clutch/ brake packages offer the ultimate in installation convenience.

Can be motor or reducer mounted, or used as a separate drive unit powered from a prime mover.
See P-8586-WE for Service Parts

## UM Smooth-Start

Soft Engage Designs

## - 5 sizes <br> [ $10-57 \mathrm{lb} . \mathrm{ft}$. torque range

Smooth-Start designs allow for a soft engage clutch and brake without sacrificing unit life.

## UM-C Series

High Performance Version for High Cycle Rate Applications

## - 3 sizes

- 6 combinations
- 16 to 95 lb . ft torque range

The UM-C units are UniModules with ceramic faced components, specifically designed for long life, high energy, and high cycle rate applications.

## Enclosed UniModule ${ }^{\oplus}$

Preassembled Units Offer Clean, Quiet Operation

## EUM Series

## Totally Enclosed Clutch and Brake Packages

- 5 sizes
- 3 combinations
- 16 to 95 lb . ft. torque range

Totally enclosed, rugged enclosure
keeps wear particles in and
contaminants out. Finned for rapid heat dissipation and long life.

See P-8586-WE for Service Parts

## EUM-W Series

Washdown Version

- 5 sizes
- 8 combinations
- 16 to 95 lb . ft. torque range

The washdown version of the EUM uses stainless steel shafting, USDA approved coating, corrosion resistant fasteners and special seals.
See P-8586-WE for Service Parts

## Shaft Mounted Clutches \& Brakes P-8587-WE

Base Mounted Clutch/Brake Combinations P-8588-WE

## Electro Clutches <br> Electro Brakes

Shaft Mounted Units

## EC Series Clutches <br> Pre-Packaged Convenience

- 6 sizes
- 16 to 465 lb . ft. torque range

All the features of an electric clutch in a convenient, pre-packaged assembly. Mounts on any through shaft or extended motor shaft. Easy-to-assemble with standard sheaves, pulleys, gears and sprockets. Packaged design. No assembly required. Long life. No maintenance.

See P-8587-WE for Service Parts

## EB Series Brakes <br> Torque Arm Mounting

- 6 sizes
- 16 to 465 lb . ft. torque range

Torque arm feature makes Electro Brakes easy to mount on any motor or through shaft. Packaged design. No assembly required. Long life. No maintenance.

See P-8587-WE for Service Parts

Advanced Technology
Clutches and Brakes
Extra Rugged Design

## ATC Series Clutches ATB Series Brakes

## Replaceable Friction Faces

- 3 sizes
- 25 to 115 lb . ft. torque range

Rugged, heavy duty units designed for extra long life and efficient operation. Cast components for durability. Finned armatures for high heat dissipation.

Friction faces are designed to allow for replacement without replacing valuable, non-wear components. Provides superior wear life with reduced engagement noise.

See P-8587-WE for Service Parts

## SFP Series Clutches

- Pre-assembled SF - No assembly required
- Ball bearing mounted field and armature
- 70 inch pound and 270 inch pound sizes
- Bore sizes from $3 / 8^{\prime \prime}$ to $1 / 2^{\prime \prime}$ and $1 / 2^{\prime \prime}$ to $1^{\prime \prime}$

SFP clutches provide the simplicity and cost efficiency of the Basic SF design, but with a ball bearing mounted armature hub.

## Electro Pack <br> Clutch/Brakes <br> Foot Mounted Units

## EP Series

Totally Enclosed Units

- 8 sizes
- 15 lb . to 1350 lb . ft. torque range

Electro Packs are rugged, preassembled clutch and brake combinations in enclosed, foot mounted housings.

See P-8588-WE for Service Parts

## EP-C Series

High Performance Version

- 2 sizes
- 15 and 70 lb . in. torque

Ceramic faced wear components provide long life for high cycle rate use. Consistent torque and cycle repeatability with Smooth-Start/stop control.

## EP-W Series

Washdown Design

- 2 sizes
- 70 and 270 lb . in. static torque ranges
- USDA approved coating

Stainless steel shaft and hardware
Available in 24 or 90 volt DC

## Electrically Released

Spring-Set Brakes \& Unibrake AC Motor Brakes P-8589-WE

## Spring-Set Brakes <br> For Power-Off Static Holding and Emergency Stopping Applications

WARNING For general use in horizontal shaft applications only. For possible vertical applications, contact technical support.

## ERS Series <br> Static Engaged

- 5 sizes
- 1.5 to 100 lb . ft. holding torque

Designed for static holding. ERS models feature multiple coil springs that force armature and friction faces together to generate braking torque when power is off. The Electromagnet counters the spring force to disengage the brake when power is applied.

Although this brake should be engaged only when the shaft is a rest, it can occasionally act as a dynamic braking device to stop a rotating load in an emergency situation.

## Spring Set Brake <br> Module

$\square 7$ to 100 lb . ft. holding torque
NEMA C-face version of the ERS Series

## ERD Series

Dynamic Braking

- 8 sizes
- 4 to 221 lb . ft. holding torque

ERD units are electrically released, static and dynamic engaged, springset brakes for power-off load holding applications. These spring-set brakes automatically stop and hold a load in the event of a power failure or other emergency stop situations. Fully dynamic friction material allows for repeated braking cycles from full motor speed with no torque fade. An optional manual release allows the brake to be released by hand.

## Unibrake Series

AC Motor Brakes

- Spring Set/Solenoid Released
- Direct acting/manual release standard 3 families
- 3, 6, 10 and 15 lb . ft. capacity
- Steel or cast iron covers
$\square$ Rear mount or double C-face designs

Permanent Magnet Brakes For Power-Off Dynamic Stopping and Cycling Applications

## FB Series

Shaft Mounted, Dynamic Braking

## - 3 models

- 10.5 to 56 lb . ft. static torque

Permanent magnet brakes are designed to dynamically stop and hold a moving load and also for high cycle rate stopping. Electric power to the coil nullifies the attraction of the permanent magnet, releasing the brake.

FB models are pre-assembled and feature a torque arm for convenient shaft mounting.

See P-8590-WE for Service Parts.

## ER Series

Flange Mounted, Dynamic Braking

- 5 models
- 10.5 to 400 lb . ft. static torque

The ER style brake offers a bulk head flange mounting system, the highest torque rating offered by Warner Electric in the power released series, high cycle rate capability, and excellent life. They require some assembly.

See P-8590-WE for Service Parts.

Notes

## EP Base Mounted Clutch/Brake

## EP-C Ceramic Faced Base Mounted Clutch/Brake

## Washdown Electro Pack

## EP Series Electro Pack

## Base Mounted Clutch/Brake Combinations in a Rugged Housing

Electro Packs are rugged, pre-assembled clutch and brake combinations in an enclosed, foot mounted housing.

They are factory aligned and pre-assembled and have been designed to mate easily with industry standard motors and reducers with v-belts, pulleys, chain and sprockets, in line couplings and timing belt drives.

## Features

- Bolt-it-down and wire-it-up . . . it's ready to go!
- Maintenance free
- A wide torque range from 15 lb . in. to 1350 lb . ft.

Typical Application

A foot mounted Electro Pack combines with a motor in a parallel shaft drive application.

## EP Series Electro Pack

## Selection/Ordering Information

Horsepower vs. Shaft Speed

*For applications with speeds below 100RPM, please contact Warner Electric Application Support.

## Selection Procedure

Determine the shaft speed at the Electro Pack location. The number listed at the intersection of horsepower and speed is the size Electro Pack you require.

## EP-C Series Electro Pack - Ceramic Faced

## PerformancePlus ${ }^{\text {TM }}$ clutch/brake combination in a foot mounted housing

 combinations in base mounted housings. They have been designed to be installed in standard power transmission systems with V-belts and pulleys, chain and sprockets, in line couplings, and timing belt drives.

When your application calls for a long life clutch/brake because of high cycle rates or demanding consistency, choose the PerformancePlus solution.

- Bolt-it-down and wire-it-up . . . it's ready to go!
- Available in two size; 170 and 250. Standard voltages are 24 V and 90V DC.
- Maintenance free.
- Ideal for use with CBC 1000 indexers and CBC 700 OEX control.

PerformancePlus ${ }^{\top M}$. . . the demanding application choice.

EP-C Product Life

## Extended Life for High Cycle Rate Use

Ceramic faced clutches and brakes have been designed specifically for rapid cycling applications to satisfy today's needs for high speed equipment. Ceramic friction material provides excellent wear resistance that extends life 3 to 5 times that of standard clutch/brakes in demanding applications.

EP-C Cycle Repeat

## Consistent Torque and Cycle Repeatability

Preloaded armatures keep the ceramic friction surfaces in light contact, providing consistent torque and cycle-to-cycle repeatability. Variation is reduced by up to $30 \%$ over standard units.

## EP-C Series Electro Pack - Ceramic Faced

## Controllability <br> Smooth Start/Stop

With the ceramic friction surfaces always in contact, dynamic torque response is fast and precise. When used with a CBC-700 over-excitation control and CBC-1000 programmable counter, exceptional closed loop clutch/brake performance can be achieved approaching that of more expensive motion control technologies The PerformancePlus difference!

## Selection

PerformancePlus Electro Packs are best suited for high energy applications where long life is a premium concern. The harder a ceramic friction surface is worked, the more wear life benefit is achieved. For slower cycle rates, up to 75 cycles per minute, dependable standard clutch/brakes are still a good choice.

For high cycle rates and high energy use (generally more than 50 cycles/minute for EP-170's and EP-250's) PerformancePlus clutch/brakes are the choice.

Technical considerations for sizing and selection are torque and heat dissipation. Each merits careful consideration, especially heat dissipation. Over temperature use will have an adverse effect on bearing life and coil wire insulation integrity.

For proper sizing information, refer to the Horsepower vs. Shaft Speed chart, and the technical sizing considerations below. When ordering, specify size, voltage, and part number.

## Horsepower vs. Shaft Speed

| HP | SHAFT SPEED AT CLUTCH (IN RPM) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\nabla$ | 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 | 1000 | 1100 | 1200 | 1500 | 1800 | 2000 | 2400 | 3000 | 3600 | 4000 | 4600 | 5000 |

*For applications with speeds below 100RPM, please contact Warner Electric Application Support.

## EP-C Series Electro Pack - Ceramic Faced

## Selection/Ordering Information

## Heat Dissipation Sizing

Friction surfaces slip during the initial period of engagement and, as a result, heat is generated. The clutch/brake selected must have a heat dissipation rating greater than the heat generated by the application. Therefore, in high inertia or high cycle rate applications, it is necessary to check the heat dissipation carefully. Inertia, speed and cycle rate are the required parameters.

These curves show the heat dissipation capability of the ceramic units.

EP-170-C

EP-250-C

Heat dissipation requirement is calculated as follows:

$$
E=1.7 \times W R^{2} \times\left(\frac{N}{100}\right)^{2} \times F
$$

where:
$E=\quad$ Heat (lb.ft./min.)
$W R^{2}=$ Total reflected inertia at the clutch/brake shaft. Include the clutch/brake output inertia. (lb.ft.2)
$\mathrm{N}=\quad$ Speed in revolutions per minute. (RPM)
$F=\quad$ Cycle rate in cycles per minute. (CPM)

Compare the calculated heat generated in the application to the unit ratings using the heat dissipation curves. Select the appropriate unit that has adequate heat dissipation ability.

## Dynamic Torque Sizing

These curves show the average dynamic torque during the slip period of engagement. Find the dynamic torque value on the curve at the clutch/brake input speed.

## EP-170-C EP-250-C

EP-170-C Maximum Speed 10000 rpm Static Torque 15 lb . in.
EP-250-C Maximum Speed 7500 rpm Static Torque 70 lb. in.

For most applications, the correct size clutch/brake can be selected from the horsepower/shaft speed selection chart. Determine the motor horsepower and the RPM at the clutch/brake. The correct size unit is shown at the intersection of horsepower and shaft speed.

If the static torque requirements are known, refer to the technical ratings chart to select a unit.

Torque Ratings

| Model <br> Size | Max. <br> RPM | Static <br> Torque | Voltage <br> DC |
| :---: | :---: | :---: | :---: |
| EP-170-C | 10,000 | 15 lb. in. | $24 \& 90$ |
| EP-250-C | 7500 | 70 lb. in. | $24 \& 90$ |

For some applications, the torque requirement is determined by the time allowed to accelerate and decelerate the load. (This time is generally specified in milliseconds.) For these applications, it is necessary to determine the torque requirement based on load inertia and the time allowed for engagement.

The torque requirements are calculated as follows:
$T=\frac{W R^{2} \times N}{308 \times t}$
where:
$\mathrm{T}=\quad$ Average Dynamic Torque (lb. ft.)
(For EP selection, multiply by 12 to convert to units of lb . in.)
$W^{2}=$ Total reflected inertia at the clutch/ brake shaft. Include the clutch/ brake output inertia. (lb. ft. ${ }^{2}$ )

| $N=$ | Speed in revolutions per minute. <br> $($ RPM $)$ |
| :--- | :--- |
| $t=\quad$Time allowed for the engagement <br> $(\mathrm{sec})$ |  |

Compare the calculated torque requirement with the average dynamic torque ratings.
Select a unit with adequate torque. If the unit selected on torque is different than the unit selected based on heat, select the larger unit size.

## Part Numbers

| Model <br> Size | Voltage <br> DC | Part No. |
| :---: | :---: | :---: |
| EP-170-C | 24 V | $5633-273-018$ |
|  | 90 V | $5633-273-019$ |
| $\mathrm{EP}-250-\mathrm{C}$ | 24 V | $5130-273-053$ |
|  | 90 V | $5130-273-054$ |

## Washdown Electro Pack

If your clutch/brake application demands consistent, repeatable performance cycle after cycle, through wet and dry conditions, choose Warner Electric's Washdown Electro Pack Clutch/Brakes.

Even in the most demanding environments, Washdown Electro Pack Clutch/Brakes (EP-W) will weather the storm. Designed specifically for use in food, sanitary or any other washdown application, these packaged clutch/brakes are totally enclosed in smooth, completely sealed, rugged enclosures to keep wear particles in and contaminants out.

Washdown Electro Packs are factory aligned, assembled and burnished for consistent out-of-the-box performance.

- USDA Approved coating
- Smooth exterior
- Shielded/sealed bearings
- Available in 70 and 270 lb -in Static torque configurations
- Available in 24 and 90 vdc

## Washdown Electro Pack Clutch/ Brakes

Warner Electric's new Washdown Electro Packs are currently available in two sizes, and in 24 and 90 volt configurations. If your application requires a different voltage or mounting configuration, please contact Warner Electric for assistance.

EP Series Base Mounted Clutch/Brakes . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . SP-2
EP-C Series Ceramic Faced Base Mounted Clutch/Brakes . . . . . . . . . . . . . . . . . . . N/A
**EP-W Electro Pack Washdown Clutch/Brakes . . . . . . . . . . . . . . . . . . . . . . . . . . . . N/A
** It is not possible to rebuild an EP-W unit without damage to the unit coating. Damaging the coating will leave the unit prone to water damage and/or provide access for bacteria. Therefore, replacement components for these products are not available.

When replacing components in clutches and brakes several guidelines are appropriate. In all cases, when replacing worn friction surfaces both the components need to be replaced. In many cases, the splined hubs should be inspected and replaced if worn.

## Common Replacement Practices:

## Electro-Pack clutch/brake

- Replace clutch rotor and armature
- Replace brake magnet and armature
- Inspect splined hub

## A note on burnishing:

When new friction surfaces are installed it will be necessary to burnish the unit prior to returning to full production rates. Burnishing is the act of wearing in the friction faces to ensure full engagement and therefore full torque. Burnishing is achieved by simply cycling the unit under less than full load (machine empty, if possible). Most units will achieve full torque in less than 100 cycles. Refer to the service manual for more details.

Note: Warner Electric Modules are designed to comply with standard NEMA frame dimensions for mounting. Reference to each particular frame size is given in the individual selection tables for each type of Warner Electric module.

## Mechanical Data Dynamic Torque

## NOTES:

Speed difference means the difference in speed between one friction face and the other at the moment of engagement. The intersection of the top curve and the speed difference is the maximum torque produced by the unit. When both friction faces are engaged and rotating at the same speed, the unit is said to be locked-in and produces the maximum static torque (zero speed difference).

The \% lines indicate the percentage of full voltage being used. Example: If 90 volt unit runs at 45 volts, use the $50 \%$ line.

Average Torque $=$ Dynamic Torque at $1 / 2$ operating speed. Example: If operating speed is 1800 , use dynamic torque at 900 .

Size $400 \quad$ Maximum Speed 4,500 rpm Static Torque 270 lb./in.

Size 170
Maximum Speed 10,000 rpm Static Torque $15 \mathrm{lb} . / \mathrm{in}$.

Size 500-SF Maximum Speed 4,000 rpm Static Torque $50 \mathrm{lb} . / \mathrm{ft}$.

Size 825-SF Maximum Speed 3,600 rpm Brg. Mtd. Static Torque $150 \mathrm{lb} . / \mathrm{ft}$.

[^0]
## Mechanical Data Dynamic Torque

Size 1000-MB Maximum Speed 3,600 rpm Static Torque $160 \mathrm{lb} . / \mathrm{ft}$.

Size 1225

Maximum Speed 3,000 rpm Static Torque 260 lb./ft.

Size 1225-MB

Speed Difference in Hundreds of R.P.M.

Size 1000 Maximum Speed 3,600 rpm Electro-Pack 3,000 rpm Static Torque $240 \mathrm{lb} . / \mathrm{ft}$.

## Rotational Speed

Rotational speed of a clutch or brake is an important consideration when selecting a unit for a particular application. Numerous factors must be considered, such as the maximum rated speed of the clutch/ brake unit, the dynamic torque required, the heat dissipation needed, the effect of speed on wear rate, and torque stability at very low speeds. Each of these issues are separate, and sometimes interrelated, but always important in selecting the right product for an application.

## Maximum RPM Rating

The most important rotational speed consideration is the maximum rated RPM capability of a unit. DO NOT exceed this rating. Exceeding the maximum RPM of a unit may cause personal injury and/or machine damage. Maximum rated speeds are based on the structural integrity of the rotating components and associated shaft and bearing capabilities. If the RPM rating is exceeded, structural failure may occur, or the unit may experience premature bearing failure and/or premature friction material wear out.

## Dynamic Torque

When determining the correct size clutch/ brake for an application, dynamic torque at the highest slip speed is often the determining factor. As you can see by reviewing the dynamic torque curves for different units as shown starting on page G-4, dynamic clutch/brake torque usually decreases with higher speeds. As slip RPM increases, the coefficient of friction of a unit decreases, causing a decrease in dynamic torque availability. Be careful to consider this when selecting the appropriate unit size needed.

## Heat Dissipation

Heat dissipation is inversely related to dynamic torque. As RPM increases, the heat dissipation ability of a unit increases. When an armature is rotating, the heat dissipation rate is proportional to the aerodynamic fan effect of the rotating armature. The faster the armature rotates, the greater the heat dissipation. This is illustrated with a typical catalog curve as shown in Figure 1. It's interesting to note that, at zero RPM, the unit still has some heat dissipation capability. This is due to convection and radiation, but is usually not an important consideration.

Figure 1: Typical Heat Dissipation Characteristics

## Wear Rate

The wear rate of friction surfaces is dependent on the clamping pressure of the mating surfaces as well as the surface velocity between the wearing surfaces. Many variables are involved in predicting wear life, of which RPM is probably the most influential. Typically, the wear rate will increase directly with the rubbing velocity distance. Another way of stating this is the higher the relative engagement speeds of two rotating parts, the longer they are allowed to slip against each other and the faster the wear rate.

## Low Speed Operation

The effect of low speed useage should also be considered in applications. Performance of clutch/brake units at less than 100 RPM may be very different than at higher RPM. This is due to "burnish" characteristics of friction surfaces.

## Wear In

"Burnish" is the wear in, or mating of two surfaces. When new, these surfaces have manufacturing features which include roughness and waviness. When these surfaces come into initial contact, only the high spots actually meet. See Figure 2. This results in only a small surface area in contact, while the non-contact surface area is "air." The result is low torque. As the mating surfaces continue to engage and slip against each other, the high spots are worn down and more surface area is in contact, thus increasing torque capability. This wear in period, or burnish, typically occurs in the first few hundred cycles of a clutch/brake's life. Faster slip speeds and higher loads mean fewer cycles needed to complete the burnish process. For applications where the speed is less than 100 RPM, the required application torque

Figure 2: Unburnished Contact Areas
should be doubled to compensate for the low speed "burnish" that the unit experiences. A low speed burnish will require many cycles before full torque and stability are achieved. For example, if an application is determined to need 20 ft.lbs. of static torque, an SF-400 clutch could be selected. But, if the application is only 100 RPM or less, then an SF-500 unit should be the choice to compensate for the low RPM useage, as indicated on the selection chart found on page G-4.

Careful consideration of rotating speeds will help the selection process of an application. Follow these guidelines and the proper clutch/brake selected will provide troublefree operation.

Many Warner Electric clutch assemblies have a bearing mounted stationery field. By design the bearing maintains its proper position between the field and rotor making it easy for the cutomer to mount the field-rotor assembly. However, the bearing has a slight drag which tends to make the field rotate if not restrained. And, since the field has lead wires attached, it must be restrained to prevent rotation and pulling of these wires. To counteract this rotational force, the field has a "torque tab" to which the customer must attach an appropriate anti-rotational restraint.

A few hints regarding proper torque tab restraints are in order. First and foremost, it is important to recognize that the force to be overcome is very small and the tab should not be restrained in any manner which will preload the bearing. For example, if the clutch is mounted with the back of the field adjacent to a rigid machine member the customer should not attach a capscrew tightly between the tab and the machine member. This may pull the tab back against the rigid member as shown in Figure 1 and preload the bearing. The recommended methods are illustrated in Figures 2, 3, and 4. The method selected is primarily a matter of customer preference or convenience.

## Electrical Data Coill Ratings

NOTES: Build-up time equals current to approximately $90 \%$ of steady state value and flux to $90 \%$. Decay time equals current to approximately $10 \%$ of steady state value and flux to $10 \%$. Approximately because current leads or lags flux by a small amount.

## Electrical Data Installation Procedure

## Recommended Electrical

Installation Procedure for Warner

## Electric Clutches and Brakes

Warner Electric clutches and brakes conform to UL (Underwriters Laboratories) requirements. All packaged products come with conduit boxes or are enclosed in housings with provision for electrical conduit connection. All sizes 400 and larger SF clutch fields and brake magnets accept UL conforming conduit boxes avaliable from Warner Electric.

The National Electrical Code (NEC) requires that conductors subject to physical damage be adequately protected. When electrical conduit is used, a minimum of 12 " of $1 / 2$ " flexible conduit is to be used between each brake and/or clutch and its box. This construction will prevent improper bearing loading in bearing mounted units and ease field and magnet assembly and disassembly.

Refer to the information below for proper installation practices and wire sizes.

Notwithstanding the above recommendations, all electrical installations should conform to NEC and/ or other governing electrical codes.

Recommended wire size versus maximum distance

| Wire Size AWG | Fractional Horsepower Sizes 170-400 |  |  | Integral Horsepower Sizes 500-1525 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Distance (feet) |  |  | Distance (feet) |  |  |
|  | 6 Volt | 24 Volt | 90 Volt | 6 Volt | 24 Volt | 90 Volt |
| 18 | 20 | 280 | 1000 | 4 | 65 | 700 |
| 16 | 30 | 430 |  | 6 | 95 |  |
| 14 | 50 | 720 |  | 10 | 160 |  |
| 12 | 75 | 720 |  | 10 | 160 |  |
| 10 | 125 |  |  | 25 | 400 |  |
| 8 | 200 |  |  | 40 |  |  |

General construction wire type MTW or THW recommended.
\#6 terminal screws (size 400 and smaller) are to be torqued to 15 in.lb.
\#8 terminal screws (size 500 and larger) are to be torqued to $20 \mathrm{in} . \mathrm{lb}$.

## Electrical Data Coil Suppression \& Clutch/Brake Overlap

Users of electric clutch and brake systems are sometimes concerned that a clutch and brake will oppose each other or "overlap"during switching, i.e., when the clutch is switched off and the brake is switched on, or vice versa. This concern relates primarily to dual armature type clutch/brakes similar to the Warner Electric Electro Module product line, as compared to shuttle armature clutch/ brakes.
In use, Warner Electric clutches and brakes are not subject to overlap when Zener diode coil suppression techniques are applied to the clutch/brake control. All Warner Electric clutch/brake controls use Zener diode suppression to eliminate any overlap situations.
The charts below graphically display current decay of the clutch and current rise of the brake with Zener diode and with straight diode suppression. In Chart 1, which shows brake and clutch operation with Zener diode suppression, the "Overlap Area" below the intersection of the brake and clutch current lines shows potential for the devices to fight one another. But this

## Brake Engagement with Zener Diode Suppression

Clutch current decay and brake current rise overlap, but the brake armature is not engaged until well past the overlap point. Note that the "blip" in the brake current trace coincides with the sharp decline in the "speed" trace, indicating brake armature engagement at that point.
intersection occurs at an extremely low current level and the armature Autogap ${ }^{\circledR}$ springs keep the friction surfaces of the brake armature and magnet separate at such low currents. Even though there is the appearance of a minor clutch/ brake overlap in this instance, the brake armature has not yet contacted the brake magnet. Chart 2 shows a much larger overlap area since straight diode suppression is used in this circuit. Clutch current has not decayed fully as the brake is engaged and the load is brought to zero speed.
Clutch and brake coils are inductors. Inductance is the electrical equivalent to mechanical inertia and an energized coil dissipates its energy when turned "off." Upon removal of power, voltage across an inductor reverses and current continues to flow in the same direction until the energy is fully dissipated. Without suppression in the control circuit, an arc can result from this potentially very large reverse voltage which can damage the electrical switching contacts.

Consequently, Zener diode suppression circuitry, by limiting the reverse voltage to

## Brake Engagement with Straight Diode Suppression

Clutch current decay is much slower than with Zener diode suppression as shown in Chart 1, greatly increasing the overlap area. The currrent level in the clutch coil is much higher at the point of brake engagement than with Zener diode suppression.
a sufficiently high but safe level, has two major benefits:

- Hastens coil decay
- Protects the switching contacts

The schematics below show circuits with no suppression and both straight diode and Zener diode suppression.
The rapid coil decay of Zener diode suppression lets users enjoy the major advantages which dual armatures have over single, "shuttle" armatures. These include:

- Better heat dissipation - greater area to give off heat and more "off" time.
- Longer life - two armatures absorb wear.
- Armature Autogap® self adjusting for the life of the unit
- Enhanced repeatability and controllability with the use of a light preload spring to keep the armatures in light contact with their mating surfaces, eliminating armature movement time and reducing noise and spline wear. Warner Electric utilizes this preload spring in some packaged clutch/brake models including ceramic EPs and Unimodules and Smooth Start Unimodules.

$$
\begin{aligned}
\mathrm{VAC} & =\mathrm{AC} \text { power source } \\
\mathrm{SW} & =\text { Clutch selector switch } \\
\mathrm{CL} & =\text { Clutch } \\
\mathrm{CNTL} & =\text { Control module }
\end{aligned}
$$

Overexcitation is a technique which makes a clutch or brake engage faster and have greatly improved starting and stopping accuracy. It involves applying over voltage to the clutch or brake coil to reduce current build up time, thereby reducing the magnetizing time.
The graphs below show current rise and shaft speed for an identical system using a Warner Electric EP-400 clutch/brake both with and without overexcitaton. The effect of overexcitation is to reduce the time needed to achieve full current and thereby reduce the time required to achieve full speed with a clutch or zero speed with a brake. In the example below, "time to start" is approximate-
ly 70 ms without overexcitation. This is reduced to 30 ms when overexcitation is applied. This time is comparable to the coil buildup times stated on page G-10. The "time to stop" has been similarly reduced; the nominally excited system requires about 110 ms to stop the load, while this is accomplished in only 50 ms with overexcitation.

Overexcitation does not increase torque. Rather, the reduction in start-stop times comes from reduced coil current build up times (or "time to current"). For many common industrial applications, the reduction in "time to speed" and "time to stop" is one half when using overexcitation.

The use of overexcitation on a clutch/ brake system does not increase system wear. In fact, the clutch/brake wear rate may be reduced because slippage and energy dissipation is marginally reduced in the clutch/brake. Compliance in the drivetrain may absorb some of the start/ stop inertia or wear may be observed in other drivetrain components. Whenever overexcitation is used, adequate coil suppression must be employed. Please refer to "Coil Suppression and Clutch/ Brake Overlap" on page G-12.

## Chart 1

## Without Overexcitation

Current/speed trace of EP400 clutch/brake being run through a single stop/start cycle. Note that 110 milliseconds is required to stop from the time the clutch coil is de-energized and the brake coil is energized. At the 200 milliseconds point on the graph the clutch coil is energized and the load is at speed 70 milliseconds later. Note that the coil current is still increasing after the load is at full speed.

## Chart 2

## With Overexcitation

Current/speed trace of EP400 clutch/brake being run through a single stop/start cycle. With overexcitation, both brake and clutch coil currents build much faster with concurrent reductions in both stop and start times, when compared with Chart 1.

## Clutch and Brake Controls

Warner Electric's electronic controls are designed to provide simple setup and maximum performance when used with electric clutches and brakes. Our controls offer a range of functions from on-off to torque control to overexcitation.

## Selection

Many parameters beyond function can impact control selection. Warner Electric produces a variety of control options to suit numerous application requirements. Control selection parameters include:

- Mounting Location - Panel or conduit box mounting
- Switching - Relay switching of A.C. or D.C. lines or solid state switching
- Output Voltage - Controls are available for 6, 24 and 90 VDC clutch/brake coils
- Input Voltage - Controls with input power transformers are available for connection to high voltage mains.

If your application requires something special, please call us. We will be happy to provide solutions.

## Clutch and Brake Controls

## Functions

## On-Off (Basic start-stop)

Many applications are controlled by energizing the clutches and brakes with their rated D.C. voltages. Warner Electric controls are available with various mounting, input voltage and switching options.

## Adjustable Torque

## (Soft start-stop)

The torque transmitted by a clutch or brake is proportional to the coil current. Warner Electric offers several products that provide torque control for smooth and repeatable starts and stops.

## Adjustable Accel-Decel

(Soft start-stop with full torque)
Warner Electric offers a control that allows for adjustment of the acceleration and deceleration time ramps to achieve a repeatable soft start or stop while still allowing for full torque.

## Overexcitation

## (Rapid cycling)

The clutch/brake speed of response can be increased for improved accuracy and performance through overexcitation, which is the application of a short high voltage pulse to provide nearly instantaneous torque.

## CBC-100/CBC-150 On-Off Controls

## Integral/Conduit Box Mounted Controls

The CBC-100 and CBC-150 series are UL listed, conduit box mounted controls for 90 volt clutches and brakes. Models are available for either 120 VAC or 220/240 VAC input.

CBC-100 series
Single unit capacity
The CBC-100 mounts inside a standard Warner Electric conduit box and includes rectification and suppression circuits.
. ©(4) us

- Compact
- Single channel
- Mounts inside conduit box

## CBC-150 series

## Dual channel capacity

The CBC-150 replaces the cover on the standard module conduit box (part no. 5370-101-042). Provides rectification and suppression for two devices. Green LED indicates power to clutch. Red LED indicates power to brake.

- c(UL)
- Dual channel
- Replaces the cover on the module conduit box

## Integral/Electrically Released Motor Brake Controls

## CBC-160

The CBC-160 series clutch/brake controls provide a single 90 VDC adjustable output for use with any clutch/ brake unit. The adjustable output will provide consistent and repeatable release for Warner Electric's 90 VDC permanent magnet electrically released brakes. The CBC-160 mounts as the cover on the standard module conduit box (part number: 5370-101-042).

## CBC-160-1

The 160-1 accommodates 120 volts A.C. motors.

## - ©(L) us

- Adjustable 30-100 VDC
- LED indicator
- 120 volt A.C. input

## CBC-160-2

The power to the 160-2 control can come from either a 230 volt or 460 volt A.C. motor. Customer-provided switching is accomplished through the motor starter on the A.C. input. This allows convenient retrofit of springset style motor brakes and inexpensive installation of new applications.

- c(4) ${ }^{\text {us }}$
- Adjustable 30-100 VDC
- Power from motor
- Easy retrofit
- 230/460 motors

## CBC-801 On-Off Controls

## Plug-in Octal Socket Power Supplies

The CBC-801 is a basic on-off power supply that provides full voltage to a 90 volt clutch or brake and is activated by an external switch. This type of power supply is sufficient for many clutch/brake applications.

## CBC-801 series

Multi-unit capacity
The CBC-801 is a plug-in power supply which is used with an octal socket. The wiring connections are made at the socket. The CBC-801 will operate two units separately-or simultaneously. Octal socket is purchased separately.

## Dimensions

- ©(L) ${ }^{\text {us }}$
- For basic on-off operation

Normal Clutch/Brake Operation (One unit on at a time)

Clutch/Electrically Released
Brake Operation
(Both units on at a time)

Soft Stop for Electrically Released Brake

The DC voltage required to release the Warner Electric ER-1225 Brake is supplied by the MCS-805-1 or MCS-805-2 Power Supply. The correct brake release voltageapproximately $35-75$ volts DC-is set by adjusting the power supply at the time of brake installation. Temperature compensating circuits provide proper operation over the entire operating range of $0^{\circ} \mathrm{F}$ to $150^{\circ} \mathrm{F}$. Switching may be provided on either the AC or DC side of the power supply. The MCS-805-1 may be mounted on its back panel or on 1/2" conduit. The MCS-805-2 has a torque adjustment capability for soft stop applications. The MCS-805-2 requires two switching circuits when used for those applications requiring soft engagement.

## Dimensions

## Connection Diagrams

Connect the MCS-805-1 or MCS-805-2 Power Supply per the following diagram and instructions:

MCS 805-1

For AC switching, switch may be in series with input supply. For DC switching, use terminals 7 and 8 as shown.
DO NOT put switch in series with load on terminals 5 and 6 .

MCS 805-2

$\mathrm{S}_{1}$ Open - brake engaged
$\mathrm{S}_{2}$ Closed - brake released
or tq. adj. mode per $\mathrm{S}_{1}$

## CBC-300 Adjustable Torque Controls

The CBC-300 Series Controls provide dual torque controls when connected to any of Warner Electric's 90 volt clutches and brakes.

- ©(u) us
- Current monitored output maintains consistent torque regardless of variation in coil temperature.
- Switch selection tunes control to exactly match current requirements and operating characteristics of each clutch or brake.
- Individual torque adjust allows preset maximum torque tailored to application requirements.
- Short circuit protection, line to line.
- Torque limiting protects machine components from damage.
- Can be used with electrically released brakes.
- Internally Fuse Protected

CBC-300 Series
Dual channel/Dual channel torque adjust
The CBC-300 has two adjustable current channels.

## CBC-500 series Dual torque adjustable power supplies

The CBC-500 series is a dual channel adjustable voltage control with optically isolated input switching for 24 and 90 volt electric clutches and brakes. These controls can be set up to energize the two outputs alternately (single) or simultaneously (dual). Refer to the Appendix for additional setup and switching information.

- Dual adjustable channels
- Optically isolated input switching
- Single or dual channel operation
- Auxiliary 12 V supply
- Can be used with electrically released brakes

## Enclosure (Optional)

- Lift off hinge
- Quick-release latches
- Conforms to NEMA Type 13
- European Standard IEC 529, IP65

## CBC-750 Overexcitation Control

## Rapid Acceleration/Deceleration

## CBC-750 Dual channel, current based OEX with switching logic

Warner Electric's CBC-750 Constant Current Overexcitation Clutch/Brake Control is a solid-state electronic control designed to increase the cycle rate capabilities and accuracies of electromagnetic clutches and brakes. The control accomplish this by sending a momentary high voltage overexcitation spike to the clutch and/or brake magnetic coil to build a high density magnetic flux field almost instantaneously. By using overexcitation, the response time is reduced as dramatically as performance is increased. For example, the current build up time of a 5 inch, 6 volt magnet is reduced from 84 milliseconds to 2 milliseconds.

The CBC-750 user selects either 120, 220 or 240 VAC operation at the time of installation, and is available for 6 volt clutches and brakes.

LED indicators on the faceplate of each control tell the user the status of input signals, output activation and any auxiliary inputs. A reset switch resets the output should a short be detected. Remote torque adjust potentiometer inputs are also provided. Appropriate current range for each size clutch or brake is selected by a dip switch. Constant current for each level is assured by the control's design.

- Maintains torque at preset levels regardless of temperature variations
- Automatically controls OEX pulse duration for optimum response without overheating coils
- Automatically prevents clutch and brake "overlap"
- Configurable as an analog follower control through remote top input
- Integral switching logic through auxiliary, inhibit and override inputs

Shown with optional cover, part number 6041-101-004

- High performance OEX control
- Constant current output capability
- Available for 6 volt clutches and brakes
- Outputs short circuit protected.
- AC/DC optically isolated inputs
- Transformer isolation Remote torque potentiometer capability
- Input/Output inhibit functions
- Switch selectable OEX function
- Automatic $\mathrm{CH} 1 / \mathrm{CH} 2$ anit-overlap feature
- Heavy duty suppression circuits
- Selectable output current ranges
- Remote status indicators inputs and outputs

## Appendix

## CBC-500/550

## Single vs. Dual Operation

The CBC-500/550 series controls allow operation in either a single or dual mode. The mode of operation is determined via the position of a jumper on the main control board.

The controls are shipped with the jumper in the J1 or single mode position. A variety of output logic can be accomplished via the single/dual jumper position and whether the control is wired to one input switching device (2-wire mode) or two input switching devices ( 3 -wire mode). The following diagrams show how each channel (output) of the control can be either alternately or simultaneously energized.

## 2-wire Switching Option

## Control's switching terminal block

| Jumper <br> Mode | Switch <br> $\mathbf{1}$ | Channel <br> $\mathbf{1}$ | Channel <br> $\mathbf{2}$ |
| :--- | :---: | :---: | :---: |
| J1-Single | Open | Off | Powered |
|  | Closed | Powered | Off |
| J2-Dual | Open <br> Closed | Powered <br> Off | Powered <br> Off |

## 3-wire Switching Option

## Control's switching terminal block

1. What transformers can be used with controls requiring 24-30 VAC input?

| Manufacturer | Part Number | Primary | Secondary |
| :---: | :---: | :---: | :---: |
| Abbott | 6B 12-160 | 115 VAC | 24V @ 6 amps |
| Quality | 6-K-119VBR | 115/230 VAC | 24V @ 8 amps |
| Signal | 24-6 | 115 VAC | 24V @ 6 amps |
| Signal | DP24-6 | 115/230 VAC | 24V @ 6 amps |
| Triad | F-260-U | 115 VAC | 24V @ 6 amps |

2. What is the difference between a MCS-801 and a CBC-801-1 or between a MCS-103 and a MCS-103-1?
There is no performance difference between the MCS-103 and MCS-103-1. There is no performance difference between the MCS-801 and CBC-801-1. The CBC-801-1 is roughly $1 / 4$ " shorter than the MCS-801. The units wire and work exactly the same.
3. Which power supplies can be used with the SF 1525HT and SFC 1525HT (used in the EP-1525HT) coil?

90V:
The SF and SFC 1525 High Torque 90V clutch coils require .794 amps of current to produce full rated torque. The following power supplies and controls will provide the needed power.

| CBC-100 | .8 amps | MCS-103-1 | 1.25 amps |
| :--- | :--- | :--- | :--- |
| CBC-150 | .8 amps | CBC-500 | 1 amp |
| CBC-801 | 1.25 amps | CBC-550 | 1 amp |

24V:
The SF and SFC 1525 High Torque 24V clutch coils require 3.14 amps of current to produce full rated torque.

Any of our 24 V controls (CBC-500, CBC-550, CBC-700) will provide this current.
4. Can I use a CBC-160 with a variable frequency drive and AC motor?
No. As the voltage to the drive is varied, the output to the electrically released brake would also vary. This would cause the brake to re-engage when it should be released.
5. Which power supplies offer a 12 VDC power source that could be used to power auxiliary switch inputs such as inductive or photoelectric sensors?

CBC-500, CBC-550, CBC-700, CBC-750
6. We plan to use a PLC in the application. Does that impact our choice of control or power supply? The CBC-801s and MCS-103-1 are not very PLC friendly. Both require a 10 amp relay for switching which is not very common for PLCs. Alternatives would be CBC-150 or CBC-500/550 respectively which are more 'PLC-Friendly'.
7. Which of the controls would allow for the independent operation of two clutches or two brakes?
Four controls allow for completely independent operation of two clutches or brakes. That is, that a clutch and brake can both be on at once, both off at once, or one on and one off. These controls are:

CBC-801-1 and CBC-801-2, MCS-103-1, CBC-300
The CBC-500/550 allows for operation of both channels on at once, both channels off at once or cycling between channel one and two. However, in the both-on/both-off mode, you cannot also do independent single channel operation.
8. Our PLC can provide 24 or 90 volts output. Why do we need a separate power supply at all?
There are two reasons to use a Warner Electric control or power supply with clutches and brakes. First, the electric coil within clutches and brakes can create a significant back EMF spike when turned off. This can damage PLC circuits (some PLCs include a diode for protection). All Warner Electric controls and power supplies include a suppression network to protect upstream electrical components from the back EMF spike. Second, this same suppression network will speed the collapse of the magnetic field within a clutch or brake. Without the suppression circuit, a clutch and brake will often overlap each other in performance with resulting poor machine performance.
9. Which controls can be used with electrically released brakes?
The CBC-160-1 and CBC-160-2 are designed specifically to use with the conduit box of EM and EUM electrically released brake designs. The CBC-160-1 and CBC-160-2 can also be used with ER and FB brake designs.

The MCS-103-1, CBC-300 and CBC-500/550 can all be used with ER, FB as well as UM-FBC, EM and EUM-FBB and EM and EUM-MBFB designs.

The MCS 805-1 and MCS 805-2 are for use only with the ER 1225 brakes. The ERS series brakes can be used with the CBC-100 or CBC-801 power supplies.

## Premier Industrial Company Leading Brands

## OTHER PRODUCT SOLUTIONS FROM ALTRA MOTION

Our comprehensive product offerings include various types of clutches and brakes, overrunning clutches, engineered bearing assemblies, gearing and gear motors along with linear motion products, belted drives, couplings, limit switches, precision motors, drives \& controls, miniature motors and engine braking systems.With thousands of product solutions available, Altra provides true single source convenience while meeting specific customer requirements. Many major OEMs and end users prefer Altra products as their No. 1 choice for performance and reliability.
